**ABSTRACT**

*Tinospora* is highly distributed in the tropical and subtropical region of India. This climbing deciduous shrub widely reported in China, Bangladesh and Srilanka. The plant is rich in many phytoconstituents that are useful in drug designing. It is highly used against cancer, tumour suppression, and act as an anti-allergic compound. It is commonly known as gudhuchi, belongs to the family Menispermeaceae. *Tinospora* is most valuable herb known for its medicinal properties from Vedic periods and cures various diseases such as malaria, asthma and urinary disorders. The genus *Tinospora* consists of many classes of chemicals such as alkaloids, diterpenoids lactones, steroids, aliphatic compounds and polysaccharides. It is the best remedy for both children as well as adults against respiratory tract diseases. The plant shows various antioxidant, anti-hyperglycemic, anti-neoplastic and hepatoprotective properties. In this review article medicinal property, chemical constituents and full description have been explored.

Keywords: *Tinospora; gudhuchi; diterpenoids; antioxidant; anti-neoplastic; steroids.*

1. INTRODUCTION

Guduchi or Giloya is the most commonly used plant which contains a large number of valued products. It has a wide history in the Indian medicinal system and considered one of the best Rasayana and is unusual in its potent versatility. In recent years, significant progress has been attained for its biological activity and medicinal applications. It is a semi-woody climbing shrub that is deciduous and perennial. This herbaceous vine grows on hedges and trees described as “one which protects the body”. It is often seen growing up Mango or Neem trees. Herbalist Sebastian Pole writes that “those growing up neem trees are said to be the best as the synergy between these two bitter plants enhances guduchi’s efficacy.” It is indigenous to areas of India, Myanmar, and Sri Lanka [1, 36]. Guduchi typically grows in deciduous and dry forests at elevations up to 1000 ft. The leaves are heart-shaped (cordifolia) and mucilaginous. Its stems, when fresh, have a green succulent bark covered by a thin brown bark and are studded with warty lenticels. When dry, the stem shrinks and the bark separate from the wood. The roots are long narrow aerial roots that arise from the branches [36]. The stems, leaves, and roots are used in medicine. All three parts should be collected in the summer when the bitter qualities are most abundant, and if not used fresh, dried in the shade. Guduchi grows well without fertilizer or pesticide making it simple to grow. It is easy to recognize and can be propagated by cuttings. Guduchi is a large glabrous deciduous climbing shrub belonging to the family Menispermaceae [37]. It is distributed throughout tropical Indian subcontinent and China, ascending to an altitude of 300 m. In Hindi, the plant is commonly known as Giloya or Amrita which is a Hindu mythological term that refers to the heavenly elixir that has saved celestial beings from old age and kept them externally young [2]. The stem of T. cordifolia is rather succulent with long filiform fleshy aerial roots from the branches. The bark is creamy white to grey, deeply left spirally, the space in between being spotted with large rosette-like lenticel. The leaves are membranous and cordate. The flowers are small and yellow or greenish yellow [3]. In auxiliary and terminal racemes or racemose panicles, the male flowers are clustered and female is usually solitary. The drupes are ovoid, glossy, succulent, red and pea-sized. The seeds are curved and pea-sized [4]. Fruits are pear-shaped, fleshy, shiny turn red when boiled. Guduchi is used as a Rasayana due to its potency of enhancing longevity and vitality. It is widely used in ayurvedic for a variety of purposes associated with inflammation allergies, neurology and glucose metabolism, general debility, fever, diabetes, dyspepsia, urinary infection, jaundice and skin diseases. In today’s world of modern medicine, it is also called a magical herb due to its property to treat a lot of diseases.

2. CLASSIFICATION

Kingdom : Plantae
Division : Magnoliophyta
Class : Magnoliopsida
Order : Ranunculales
Family : Menispermaceae
Genus : Tinospora
Species : cordifolia

2.1 Total Species

Some observers found that there are total 15 species and out of these some of the medicinally important species are T. cordifolia, T. crispa, T. cordifoli, T. malabarica, T. tomentosa, T. uliginosa etc [1].

2.2 Vernacular Names

Assamese : Siddhilita, Amaralata
Bengali : Gulancha
English : Heartleaf moonseed
Gujarati : Galac, Garo
Hindi : Giloe, Gurcha
Kannada : Amrutaballi
Kashmiri : Amrita, Gilo
Malayalam : Chittamrutu
Marathi : Gulvel
Oriya : Guluchi
Punjabi : Gilo
Sanskrit : Amrit
Tamil : Seendal, Seendi Kodi
Telugu : Thippateega
Urdu : Abb-e-Hyat

3. BOTANICAL DESCRIPTION

T. cordifolia is a large, perennial, deciduous, climbing shrub with the succulent stem. The stem is fibrous and having wedge-shaped wood bundles with large vessels. The bark is papery, creamish white in colour, left spirally and stem containing rosette-like lenticles. The leaves are simple, alternate and cordate in shape also consist of 7-9 nerves on the entire leaf [5]. Flowers are axillary, small, cymose, yellow-greenish in colour. Male and female flowers are
always originated on separate branches. Male flowers are present in cluster form while female flowers are in the solitary form [6]. The best time for the growth of flower is during summer [7]. Sometimes small yellowish flowers are also present on long spikes. Fruits of *Tinospora* are pea-shaped shiny, draping and become red when fully grown. Fruits are generally single-seeded and fleshy. The fruits get maturity in the winter season. Seeds are hooked or curved in shape. The root portion is aerial, thread-like, long, fleshy and is in branching form.

### 4. HABITAT AND DISTRIBUTION

*T. cordifolia* prefers subtropical and tropical for growth. For better cultivation, light-medium sandy loam soil rich in organic matter and with adequate drainage is suitable. This plant is highly grown tropical India, South Asia, Indonesia, Philippines, Thailand and China. The plant is also observed from the South East Asian continent such as Malaysia, Indonesia and Tamilnadu.

### 5. CLIMATE AND SOIL

The plants preferred subtropical and tropical conditions for proper growth. For better cultivation, light-medium sandy loam soil rich in organic matter and with adequate drainage is suitable. It shows low resistance towards high rainfall or waterlogged conditions. Stem cutting is the best method to enhance commercial use.

### 6. FLORAL AND FRUIT STUDY

Inflorescence starts in the summer season. The male flowers are small in size, yellow or green in colour, and occur in groups. While female flowers are usually green and solitary in nature. The fruit size and shape is like a pea pod and turns green to red when ripe in winter.

### 7. CHEMICAL CONSTITUENTS

A number of chemical constituents have been extracted from the different parts of *T. cordifolia*. These chemical constituents belong to different classes viz; alkaloids, diterpenoid lactones, steroids, glycosides aliphatic compounds, polysaccharides. The main constituents of this plant are tinosporone, tinosporic acid, cordifolisides A to E, syringe, berberine, gilonin [8]. The chemical constituents in different parts and its uses are given in the Table 2.

It also contains various other chemicals like flavonoids, glycosides, saponins and little amount of phytosterols. These chemicals show antioxidant activity when these are combined with other drugs. These main constituents which are present in a very high amount are alkaloids and terpenes. The leaves are the rich source of protein, calcium as well as phosphorus.

### 8. TOXICOLOGY

In human beings, toxic effects of *Tinospora* is very less known. But sometimes its high dose causes some harmful effects on the body. It might lower blood sugar level, use it carefully if anyone has diabetes, it also increases the symptoms of autoimmune symptoms. It is also advised to avoid the intake of *Tinospora* during pregnancy and breastfeeding time [16].

### 9. AYURVEDIC PROPERTIES

Ayurveda is one of the most ancient medical sciences of the world. Rasayana is one of the eight clinical specialities of classical Ayurveda [37]. The concept of Rasayana therapy is not a single drug. Treatment but it is a comprehensive and specialized regimen capable of producing healthful longevity and improved mental facilities. Several medicinal plants have been described as Rasayana in Ayurveda [17].

Fig. 1. Schematic representation of different parts of *Tinospora* plant and their folk uses

- **Stem** (succulent, fibrous)
  - Pills are prepared from the paste of stem of *T. cordifolia* and roots of *Solanum xanthocarpum* used in the treatment of fever
  - Decoction of stem is administered orally for the treatment of fever

- **Leaves** (simple, alternate and coriaceous in shape)
  - Juice or decoction of leaves is administered orally with honey in fever by the local people of Patyala (Punjab)

- **Flower** (axillary, small, cymose, yellow-greenish)

- **Root** (aerial, thread-like, long, fleshy in branching form)
  - Decoction of root is used for the cure of dysentery and diarrhoea

- **Seed** (hooked or curved)

- **Fruits** (single seeded and fleshy)
  - Dried fruit powder mixed with ghee or honey, is used as a tonic and also in the treatment of jaundice and rheumatism

**Immunomodulatory activity**
- **11-hydroxymustakone, N-methylc-2-pyrrocholine, N-formylalanin, cordifolin, A, magnoflorine, tinosoraidine and syringing** showed immunomodulatory activity
- Standard dose, extract increased the E-amylose activity and cellularity of bone marrow in rats

**Anti-inflammatory activity**
- Suppressed acute inflammatory response caused by carrageenan
- Water extract of stem part showed anti-inflammatory role in case alloxon rats

**Tinospora cordifolia**

**Hepatoprotective activity**
- Effect of free radicals and antioxidant activity with the suppression of lipid peroxidation
- Extract of whole plant showed protection against CCL4

**Anti-cancer activity**
- Effective in reducing the metastatic potential of B16-F10 melanoma cells
- 12-n-octyl-palmitate (14) displayed potent cytotoxic activity against seven cancer cells

**Anti-HIV activity**
- Reduction in eosinophil count, stimulation of TH lymphocytes, macrophages and polymorphonuclear leukocytes and hemoglobin percentage

Guduchi is considered one of the best Rasayans and it is unusual potent versatility. Guduchi is known to be a rich source of trace elements (Zinc & Copper) which act as antioxidants & protects cells from the damaging effects of oxygen radicals generated during immune activation. Rasayan effect of Guduchi can be used to heal & prevent infections. Rasayana used as a universal vaccine for any diseases. Rasayana chikitsa is mainly used to maintain the health of individuals although it can be used for diseased also.

10. MEDICINAL PROPERTIES

1. Immunomodulatory activity: The alcoholic extract of T. cordifolia showed significant immunomodulatory effects. At standard dose, extract increased the α-amylase activity and cellularity of bone marrow in rats. It had been observed by some researchers that some active compounds viz; 11-hydroxymustakone, N-methyl-2-pyrrolidone, N-formylannonain, cordifolioside A, magnoflorine, tinocordiside and syringing showed immunomodulatory activity [31]

2. Anti-inflammatory activity: The water extract of stem part showed anti-inflammatory role in albino rats. It has significantly suppressed acute inflammatory response caused by carrageenan extract when applied orally [15].

3. Hepato-suppression: The extract of the whole plant showed protection against CCl₄ because it causes hepato-cellular changes after forming proteins or by forming bioaction of CCl₄ and accelerated toxification. It also showed potential to reduce the effect of free radicals and antioxidant activity with the suppression of lipid peroxidation, therefore this plant considered as hepatoprotective agent [32].

4. Anti-HIV activity: TCE reduced the recurrent resistance of HIV virus and enhancing the therapeutic outcome [33]. Anti-HIV effects of TCE was revealed a reduction in eosinophil count, stimulation of B lymphocytes, macrophages and polymeronuclear leucocytes and haemoglobin percentage thus, revealing its promising role of application in the management of the disease [34].

5. Anti-cancer activity: The anti-cancer effects of T. cordifolia are mostly studied in animal models. TCE has been shown to have a radioprotective role by significantly increase in body weight, tissue weight, testes-body weight ratio and tubular diameter and inhibit the harmful effects of sub-lethal gamma radiation on testes in male Swiss albino mice [35,36,37,38,39]. In pre-irradiating mice, TCE significantly effected radiation-induced rise in lipid peroxidation and resulted in the decline of GSH concentration in testes. Pre-treatment of HeLa cells by TCE has been shown to decrease the cell viability, increase LDH and decrease in GSH S-transferase activity [40].

11. CONCLUSION

The present study explores the detailed information of T. cordifolia and its therapeutic efficiency about the medicinal uses explained in medicinal systems. The phytochemical, pharmaceutical and biological investigation of T.
*Tinospora cordifolia* reports the versatility and explains its diverse role. It is concluded that this miracle herb had been used traditionally among the various communities across the tribal region of worldwide for a plethora of ailments, such as urinary, gastrointestinal, skin, pulmonary, hepatic, gynaecological, inflammatory, and infectious diseases. In addition to this, the species is also well known to treat allergy, tumour and cancer by the traditional and local medicinal practitioners. Almost all parts of the plant are used for curing different but the most frequent part used is rhizome followed by root. In recent times, the old traditional practices are at gradually decline very rapidly and under risk due to rapid modernization hence there is an urgent need for documentation of such tribal species and help to find innovative ways for untap its efficiency used for human welfare in future.
