Organic farming is based on the system-oriented approach and the use of an organic liquid product like Panchagavya resulted in higher growth, yield and quality of crops and hence there had been an increasing interest in the use of liquid formulations. The present study was carried out to validate the shelf life of panchagavya and jeevamruth by screening scientifically under in vivo condition using maize (Zea mays l.). The liquid organic formulations like jeevamruth, panchagavya and the panchagavya formulations with groundnut oil cake and sesame oil as a substitute to ghee were freshly prepared and used for further studies. In all the panchagavya formulations, the root length and shoot length of the maize plants increased as compared to other treatments. The maximum shoot length 20.67 cm and root length of 9.14 cm were recorded in panchagavya treatment and minimum shoot length 18.39 cm and root length of 6.15 cm was recorded in jeevamruth treated seeds. The panchagavya treated seeds registered the maximum vigour index of 2980.

Keywords: Vigour index; jeevamruth; panchagavya; shelf life.
1. INTRODUCTION

Organic farming is based on the system-oriented approach and can be a promising option for sustainable agricultural intensification in the tropics. Organic farmers rely on crop rotation, green manures, compost, biological pest control and mechanical cultivation to maintain the soil productivity and for controlling the pests [1]. It may offer several potential benefits such as a greater yield stability especially in risk-prone tropical ecosystems, higher incomes in traditional farming systems, an improved soil fertility and long-term sustainability of farming systems, a reduced dependence of farmers on external inputs, the restoration of degraded or abandoned land, the access to attractive markets through certified products and new partnerships within the whole value chain, self-confidence and autonomy of farmers (Mendez et al., 2010).

The liquid formulations such as panchagavya, jeevamruth and beejamruth were ecofriendly organic preparations made from products of the cow. Among these, panchagavya is one of the widely used traditional liquid organic formulations, which is a fermented product made from five ingredients obtained from cow, such as milk, urine, dung, curd and clarified butter [2]. In panchagavya, the number of beneficial microorganisms was found to be high under higher acidity. They have not only enhanced the microbes in the environment but also acted as a catalysts with a synergistic effect to promote all the useful microbes of the environment and these microorganisms secrete proteins, organic acids and antioxidants in the presence of organic matter and converted them into energy thereby the soil microflora and fauna changed a disease-inducing soil to a disease suppressive soil [3].

2. MATERIALS AND METHODS

2.1 Testing of the Effective Liquid Organic Input on Plant Growth under Laboratory Condition Roll Towel Method

The plant growth-promoting liquid organic inputs viz., panchagavya, panchagavya (groundnut oil cake instead of ghee, panchagavya (sesame oil) and jeevamruth were tested preliminarily on maize. These maize seeds were assessed based on the seedling vigour index by the standard roll towel method (ISTA, 1993). Ten maize seeds were kept over the pre-soaked germination paper. The seeds were held in position by placing another pre-soaked germination paper strip and gently pressed. The polythene sheet covered with pre-soaked germination paper was then rolled and incubated in the growth chamber for 15 days. Three replications were maintained for each treatment. The root length and shoot length of individual seedlings were measured and the germination percentage of seeds was also calculated. The vigour index was calculated by using the formula as described by Abdul Baki and Anderson [4].

Vigour Index = (Mean root length + Mean shoot length) x Germination (%)

3. RESULTS AND DISCUSSION

3.1 Roll Towel Method

The germination study was conducted to find the effect of liquid organic formulation on maize seeds. The overall results revealed that the seedlings growth and seedling vigour recorded high in panchagavya treated seeds when compared to jeevamruth. The maximum shoot length 20.67 cm and root length of 9.14 cm were recorded in panchagavya treatment and minimum shoot length 18.39 cm and root length of 6.15 cm was recorded in jeevamruth treated seeds. The maximum vigour index of 2980 was observed in panchagavya applied treatment and minimum value of 2451 was observed in jeevamruth treatment (Table 1) (Fig 1). The highest germination percentage, shoot length, root length and vigour index of maize seedling was significantly influenced by per cent panchagavya formulation. Computation of vigour index using germination percentage and seedling growth characters derived a consolidated value which was used to delineate best treatments from others. Srimathi et al. [5] reported that seeds of Jatropha curcas and Pongamia pinnata fortified with panchagavya at the rate of 2, 3 and 5 per cent showed best in growth over control. The better seed invigoration and metabolic activity were due to the reason that panchagavya encompasses almost all the major nutrients, micronutrients and growth hormones [6] and the number of beneficial microorganisms protected it from seed infections. Vigour assumed greater importance in storage and potential production of any crop. Thus the panchagavya formulations could be better utilized for crop production of maize. This eco-friendly liquid organics (panchagavya) could help to obtain the best yield of maize and so the shelf life was also studied.

4. CONCLUSION

The overall results revealed that the seedlings growth and seedling vigour recorded high in panchagavya treated seeds when compared to jeevamruth. Thus the panchaguya formulations could be better utilized for crop production of maize.
